

VISIONS OF THE FUTURE

Remote Viewing

...remote-viewing is "a mysterious human ability to know things in spite of being shielded from that knowledge by time or space or both."

demonstrates that the ability transcends time and space to gather information using more than our usual five senses. This ability is innate within our mind/brain wiring, an inner sonar. This natural ability is always present acquiring current and future data and presents its subtle images for our viewing at any moment.

Learning to identify this quiet information takes a skill that is not acquired quickly; it takes training to identify this marvelous mechanism and understand its utility in ones' daily life.

mind. It is independent of space, therefore, I can access that information any place on the planet or off of it if I choose."

Researcher Stephan A. Schwartz says remote-viewing is "a mysterious human ability to know things in spite of being shielded from that knowledge by time or space, or both." In addition to laboratory study on the topic, Schwartz, a Senior Fellow at the Samuelli Institute, and his team have successfully used remote-viewing for archeological discoveries.

Thanks to remote-viewing, Schwartz and his team made an important archaeological discovery, the identification and location of an ancient seawall which extends about sixty-five meters further out into the harbor of Alexandria, Egypt than was previously suspected. This location resolves a key piece in the puzzle of the ancient city's complex layout. Without the use of remote-viewing, these discoveries in Alexandria, Egypt might still be unknown.

Everyone recalls the experience of seeing something far away and predicting the future. The technical term for this is remote-viewing, the practice of seeing events and objects from afar. Many have tried to replicate this experience instead of waiting for visions.

Remote-viewing is a discipline that can heighten the awareness of our strong senses and intuitions and can be used for personal growth and spiritual development. Because remote-viewing can be used in either way, its potential for growth, healing and exploration is tremendous.

One only need recall the ancient prophets or Seers to begin the understanding of remote viewing. These historical Icons had developed their natural ability of 'seeing' the future. Today we can readily understand this ability best not as a form of spiritual development but rather a military one. As the former Soviet Union of the 60's and 70's had their top secret spy program well underway using individuals with a highly developed ability to 'see' distant people, places and events, the U.S. government's CIA program at Langley, Va. tested remote-viewing from the 1970s until the mid-1990s. Explicitly for military purposes, the CIA drafted soldiers into the program producing remote viewers making uncanny predictions about future events and view unseen objects. The theory was that people can use paranormal abilities to see distant locations via extra-sensory perception (ESP). The theory worked!

Unwrapping the mystery of remote-viewing

What began as a top secret, \$20 million dollar United States military intelligence program more commonly known as Project Star Gate, to combat the cold war Russian psychic spies, has now blossomed into a worldwide civilian remote-viewing community used by normal people every day.

"Learning the art of remote viewing is like training for a martial art—it takes many years of practice and dedication to become confident and competent," says Daz Smith, from the Remote Viewed website. "Remote-viewing is as much about learning about yourself and how the universe speaks to you as it is a method to transcend time and space."

It is important to understand: remote-viewing is not exactly how it sounds, like the viewing of a movie of psychic impressions in our heads. *"Remote-viewing is a mixture of senses and sensations; touch, sound, smells, tastes and many more very subtle impressions and feelings all working together to try to tell you what the target is,"* says Smith. *"Remote-viewing is like a gradual opening of a window to the target where each impression builds on the one before, slowly revealing the target to you."*

Major General Albert Stubblebine, former commanding officer of the U.S. Army Intelligence and Security Command (INSCOM) concludes: *"(It) is a very systematic, very controlled method of accessing information that is not normally available by any other source. It is independent of time. I can go present, I can go future. It is independent of location, so I can go anywhere on this earth, I can go into any closet, I can go into any*

Schwartz also employed remote-viewing in Jamaica. *"The Columbus Caravels Project is a multi-phase research program designed to locate and excavate from St. Ann's Bay, Jamaica the remains of Columbus' last two ships, Capitana and Santiago de Palos. After an enforced exile of a year and five days, Columbus and his marooned crew were finally rescued on June 29, 1504. They departed for Hispaniola and Spain, leaving behind two of the oldest recorded shipwrecks in the Western Hemisphere, and the earliest European site in Jamaica."* Remote-viewing was used in this project to find the location of the ship, and to describe the underwater and surface geography of this location.

Every person has psychic abilities, a built-in sonar if you will. At the Ramtha School of Enlightenment (RSE), the very first day of beginner students training starts off with a remote view exercise without any formal instruction. The purpose of this unusual start is to introduce the student to their remarkable ability without training. The results are impressive revealing that 70% of the class accomplished accurately the remote view.

Most students are surprised while others marvel at their own unused abilities. Further training, coupled with knowledge and exercise, heighten the unfolding of each person's skills. The RSE curriculum involves training people to use the latent abilities in their brain as a daily exercise, and then integrating that knowledge into their lives.

To test the ongoing efficiency of remote-viewing
